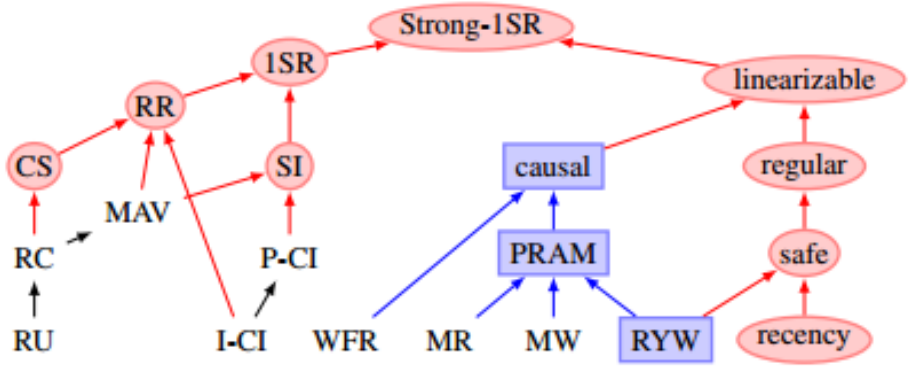
Distributed key-value stores

```
put(K key, V val)     get(K key)
```

Transactional semantics

existential consistency atomic visibility example

Transactional consistency models



Snapshot isolation (SI):

- Read from the latest consistent snapshot of all data items
- No write conflicts among concurrent transactions

Distributed SI

Costs of SI

Relaxed variants of SI:

- GSI [1]
- NMSI [2]
- PL-FCV [3]
- PSI [4]

[1] GSI: Generalized Snapshot Isolation
[2] NMSI: Non-Monotonic Snapshot Isolation
[3] PL-FCV: Forward Consistent View
[4] PSI: Parallel Snapshot Isolation

Two drawbacks

1. Unbounded inconsistency
   - no specification of the severity of the anomalies w.r.t SI
2. Untunable at runtime
   - determined at the system design phase
   - remain unchanged once the system is deployed

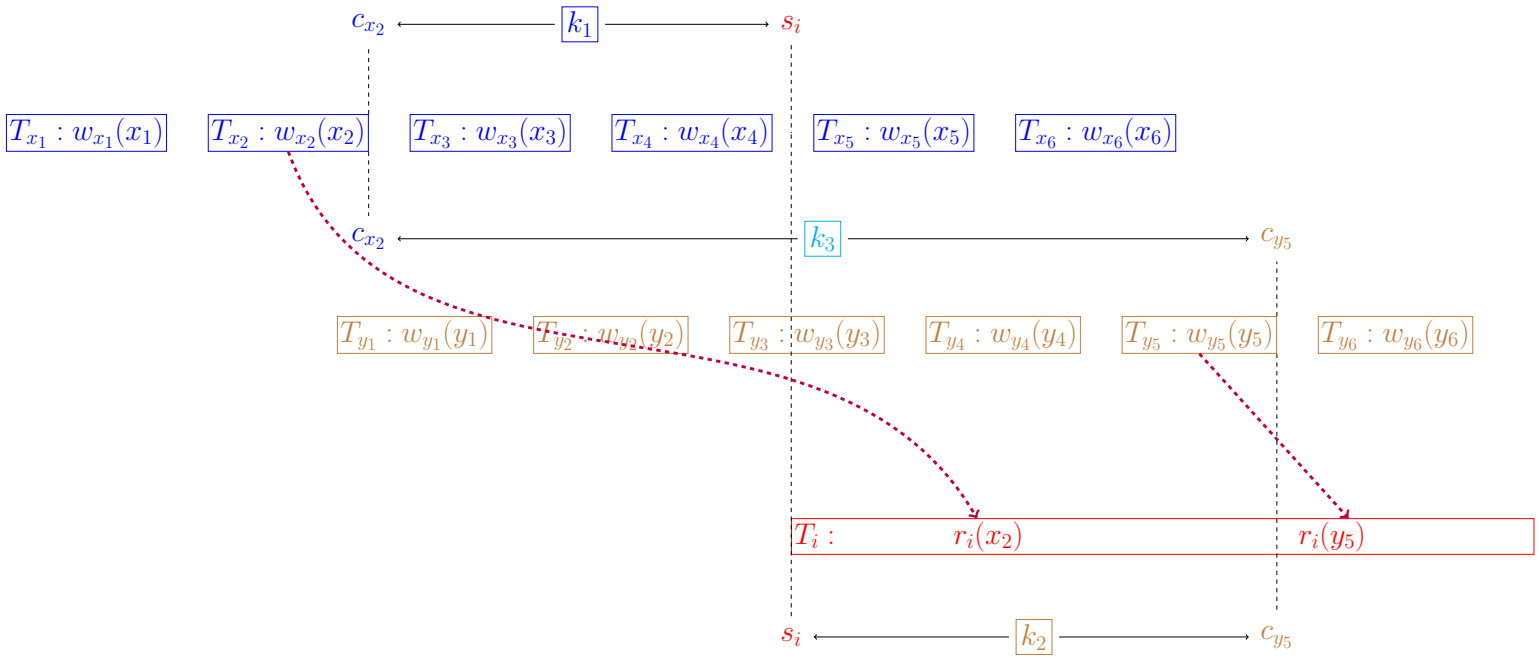
Illustration of RVSI



Definition of RVSI

(k_1-BV)

$$\forall r_i(x_j), w_k(x_k), c_k \in h : \left(c_j \in h \wedge \bigwedge_{k=1}^{m} (c_j \prec_h c_k \prec_h s_i) \right) \Rightarrow m < k_1,$$

(k_2-FV)

$$\forall r_i(x_j), w_k(x_k), c_k \in h : \left(c_j \in h \wedge \bigwedge_{k=1}^{m} (s_i \prec_h c_k \prec_h c_j) \right) \Rightarrow m \leq k_2,$$

(k_3-SV)

$$\forall r_i(x_j), r_i(y_l), w_k(x_k), c_k \in h : \left(\bigwedge_{k=1}^{m} (c_j \prec_h c_k \prec_h c_l) \right) \Rightarrow m \leq k_3.$$

Definition of RVSI

$$h \in \mathsf{RVSI} \iff h \in k_1\text{-}\mathsf{BV} \cap k_2\text{-}\mathsf{FV} \cap k_3\text{-}\mathsf{SV} \cap \mathsf{WCF}.$$

Theorem

$$\mathsf{RVSI}(1, 0, *) = \mathsf{SI}.$$

3. CHAMELEON Prototype and RVSI Protocol

Chameleon Protocol

Chameleon:

A prototype **partitioned replicated**

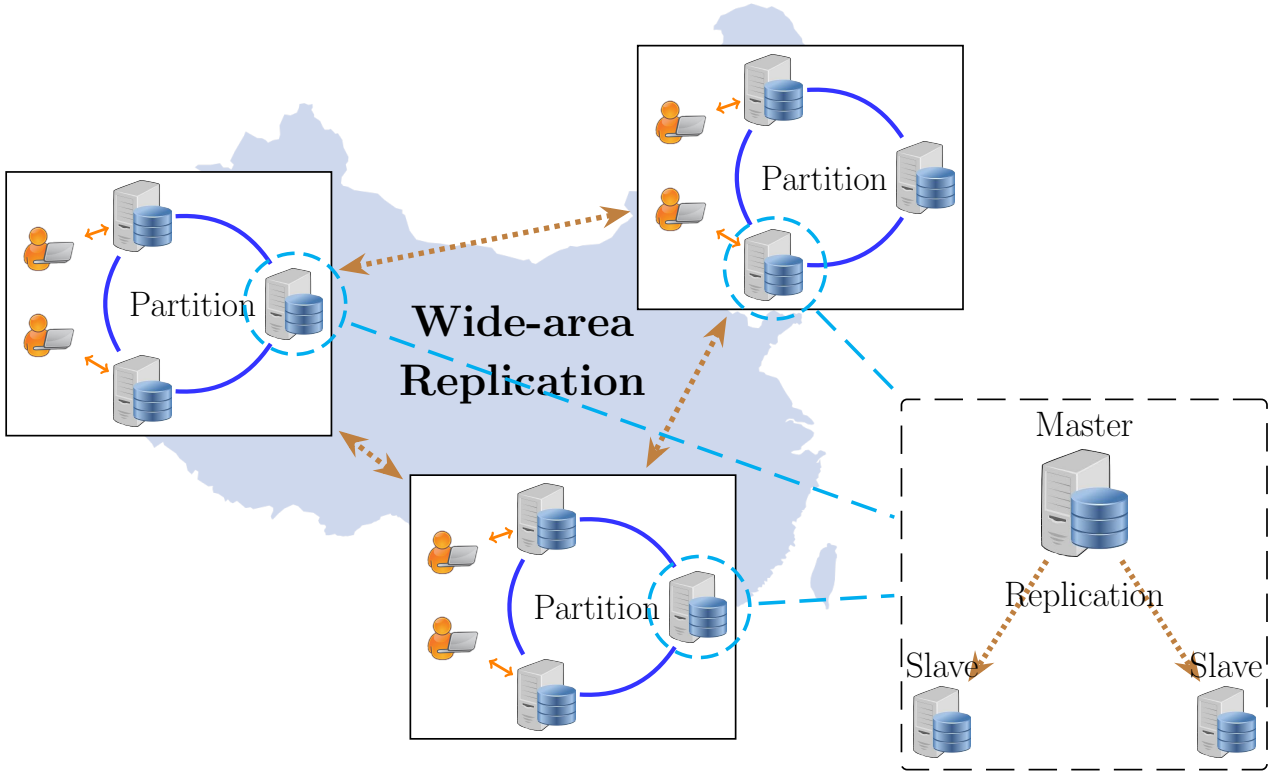
distributed transactional **key-value** store

CHAMELEON Prototype

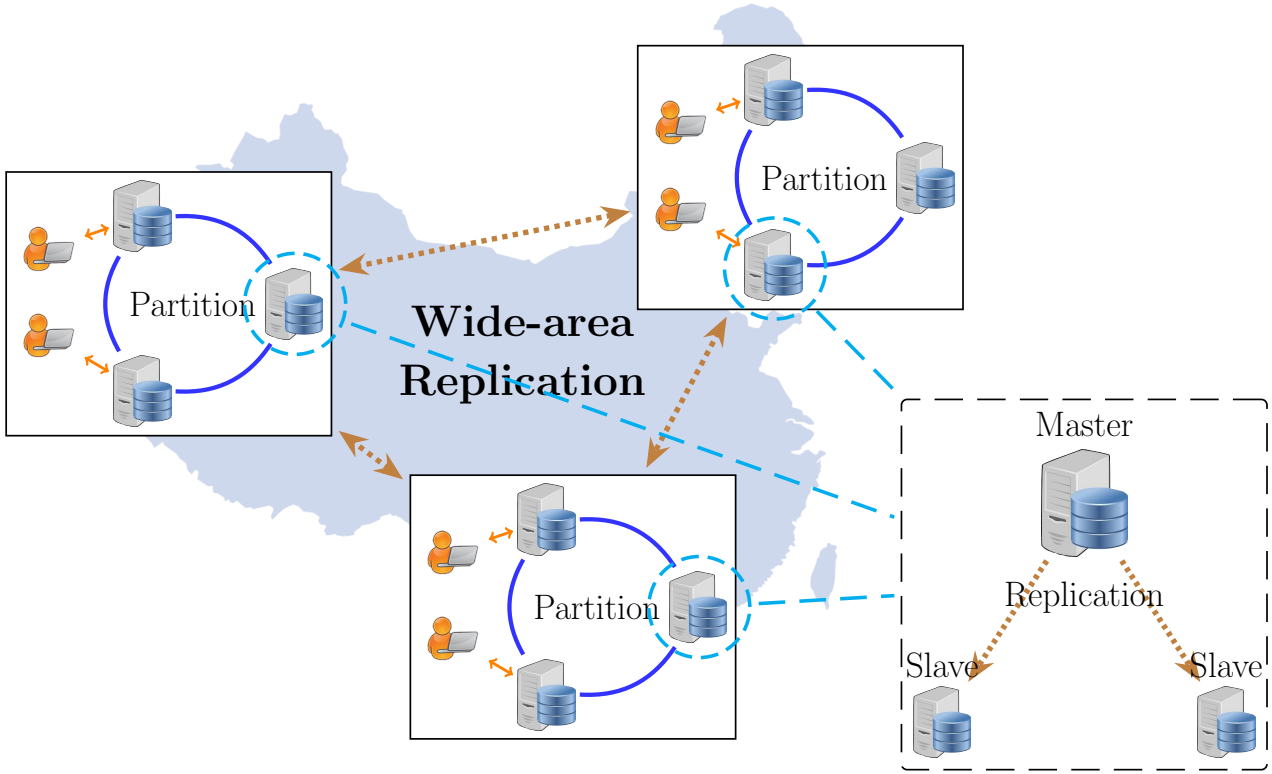
Classic **key-value** data model

Key: (row key, column key)

CHAMELEON Prototype

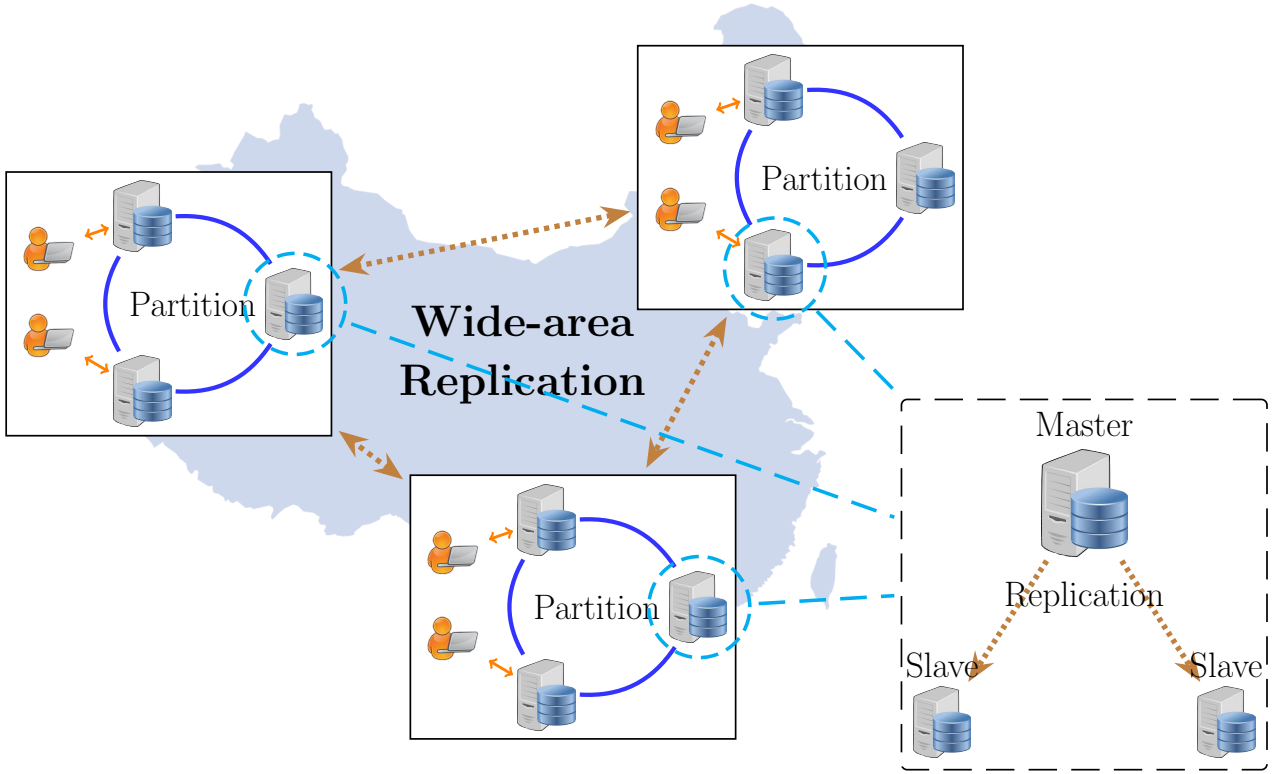


CHAMELEON Prototype



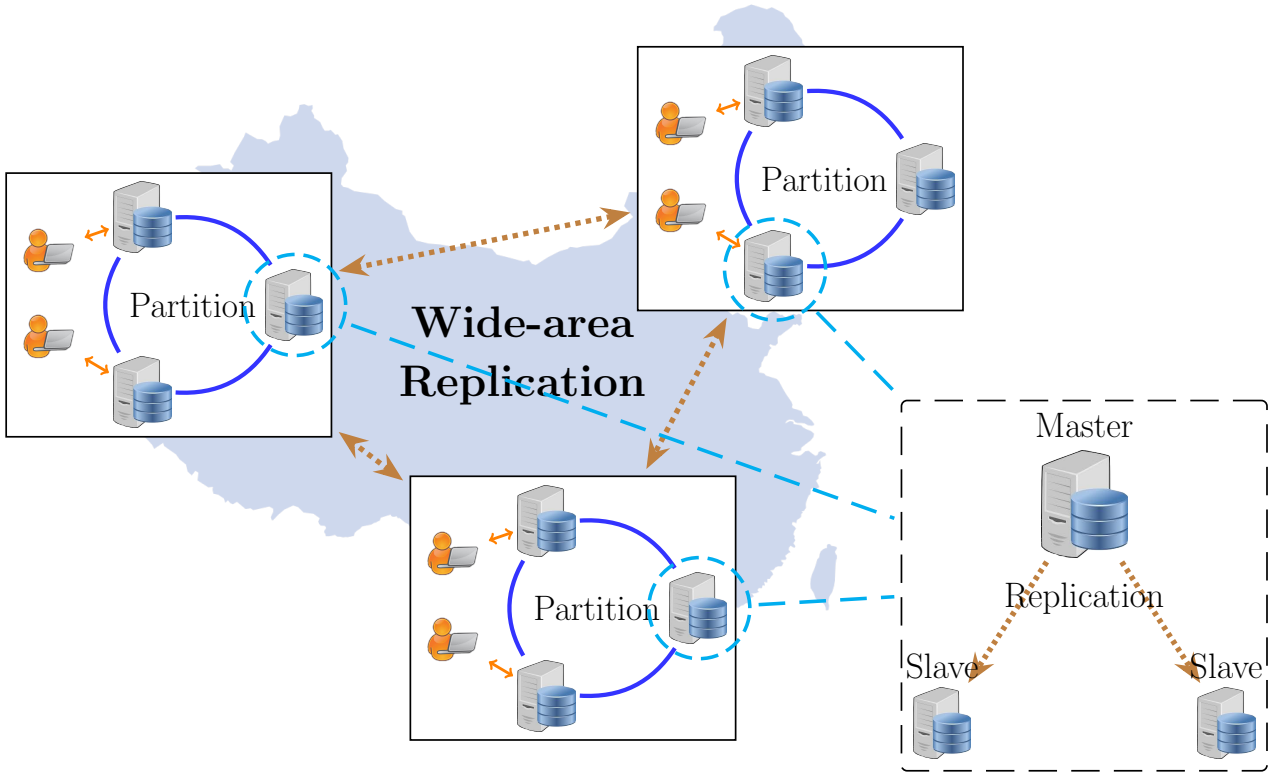
Keys are **partitioned** within a single datacenter.

CHAMELEON Prototype



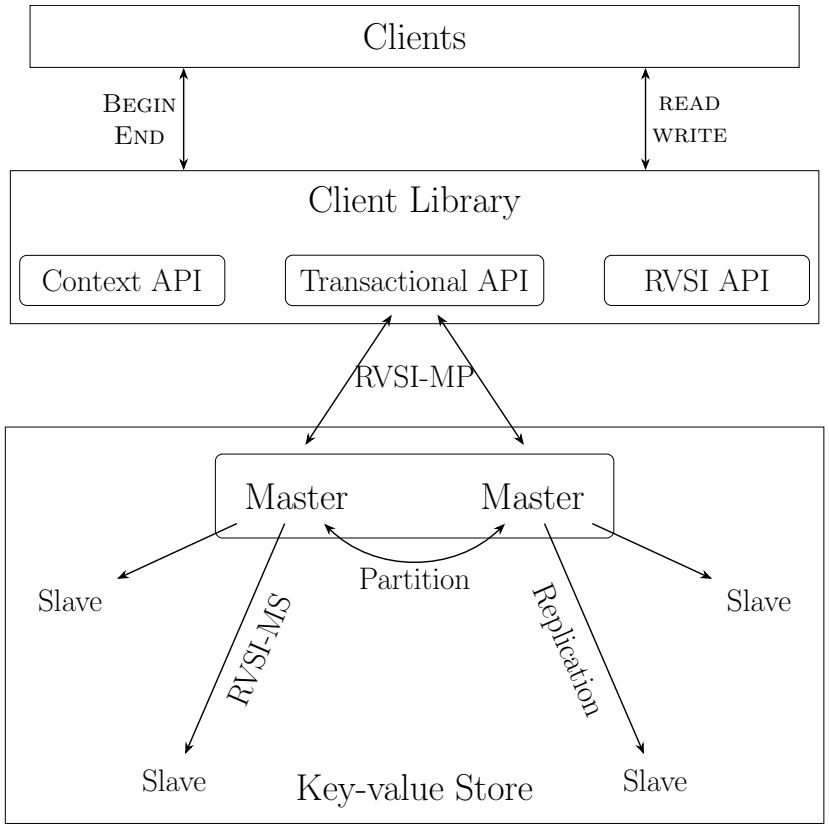
Each key is **replicated** in a master-slave manner across datacenters.

CHAMELEON Prototype



Transactions are first executed and committed on the masters, and are then asynchronously propagated to slaves.

CHAMELEON Protocol



CHAMELEON Protocol

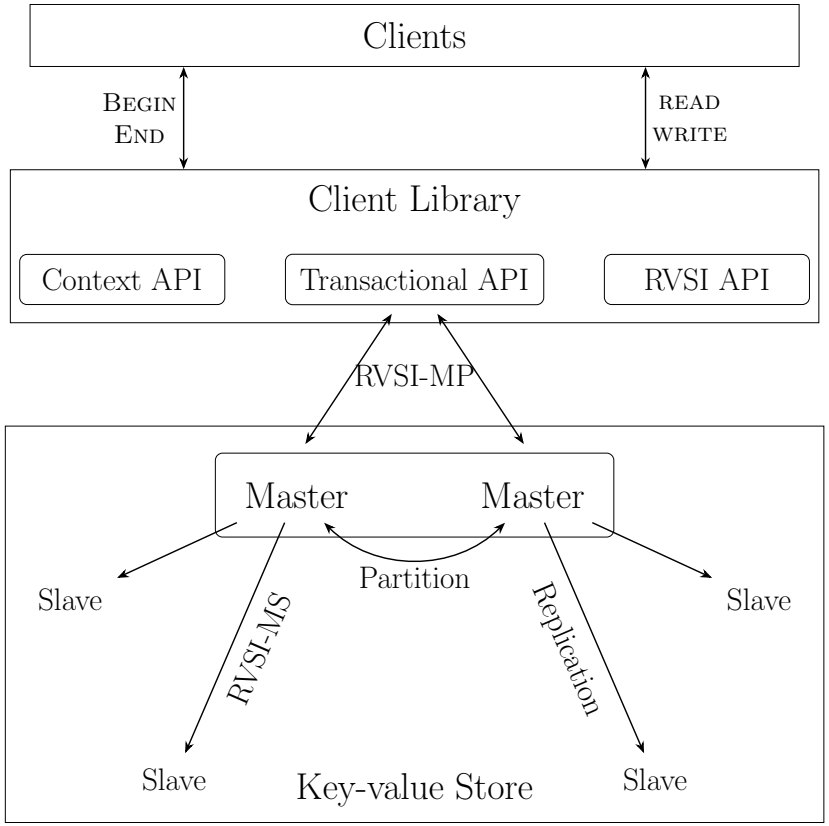
CHAMELEON Protocol



Client library

CHAMELEON Protocol

```
// Initialize keys (ck, ck1, and ck2) here
ITx tx = new RVSITx(/** context **/);

tx.begin();

// Read and write
ITsCell tsCell = tx.read(ck);
ITsCell tsCell1 = tx.read(ck1);
tx.write(ck1, new Cell("R1C1"));
ITsCell tsCell2 = tx.read(ck2);

// Specify RVSI specs. (e.g., SVSpec)
RVSISpec sv = new SVSpec();
sv.addSpec({ck, ck1, ck2}, 2);
tx.collectRVSISpec(sv);
